

ANGLE ADJUSTABLE PEDALS FOR ELLIPTICAL EXERCISERS

FIELD OF THE INVENTION

The present invention relates to an elliptical exerciser having two pedals which are angle adjustable so as to meet different requirements
5 of the users.

BACKGROUND OF THE INVENTION

A conventional elliptical exerciser 10 is disclosed in Fig. 1 and generally includes a frame 11 and a wheel 12 is connected thereto, a crank 13 is connected to the wheel so that a user may hold the handle 15 and 10 step on the pedals 161 on the pedal frame 16 to operate the exerciser. A connection bar 14 is pivotably connected to an end of the crank 13 and the other end of the connection bar 14 is connected to the handles 15. One end 15 of the connection bar 14 is pivotably connected to an end of the pedal frames 16 and the other end of the connection bar 14 is pivotably connected to a link which is pivotably connected to the frame 11. The user holds and swings the handles 15 while the feet alternatively operate the pedals 161 in an elliptical trace. The pedal frames 16 each have a roller 162 which is rolls on a rail 17 on the ground. The rails 17 can be raised at an angle relative to the ground so as to adjust the exercising levels to meet 20 different requirements of the users. Nevertheless, as disclosed in Fig. 2, the pedals 161 and the pedal frames 16 are made as a one-piece so that the pedals cannot be adjusted according to the change of the rails 17.

The present invention intends to provide angle adjustable pedals for elliptical exercisers wherein the pedals can be adjusted relative to the pedal frames.

SUMMARY OF THE INVENTION

In accordance with one aspect of the present invention, there is provided an pedal assembly for an elliptical exerciser and the pedal assembly includes a pedal frame having a first end pivotably connected to

5 a connection bars connected to the crank on the wheel, and a second end of the pedal frame has two side walls. An end plate is connected between the two side walls and each side wall has a hole and three notches are defined in an inside of the hole. A roller is connected to the pedal frame and movably engaged to the rail.

10 A pedal has two connection plates which are pivotably connected to the two side walls of the pedal frame. Each connection plate has a set slot and a reset slot defined therethrough. The set slot and the reset slot communicate with each other and a angle is defined between two axes of the set slot and the reset slot. A pin extends through one of the set

15 slot and the reset slot and the hole. A bolt extends through the end plate and is fixedly connected to a mediate portion of the pin. A spring is mounted to the bolt and biased between the pin and the end plate.

The present invention will become more obvious from the following description when taken in connection with the accompanying

20 drawings which show, for purposes of illustration only, a preferred embodiment in accordance with the present invention.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 shows a conventional elliptical exerciser;

Fig. 2 is a perspective view of the pedal of the conventional elliptical exerciser;

Fig. 3 is a perspective view of the pedal assembly of the present invention;

5 Fig. 4 is an exploded view to show the pedal assembly of the present invention;

Fig. 5 is shows the elliptical exerciser with the pedal assembly of the present invention;

10 Fig. 6 shows the pin is engaged with the first notch in the hole of the pedal frame when the rails are positioned at the first position as shown in Fig. 5;

Fig. 7 is shows the elliptical exerciser with the pedal assembly of the present invention;

15 Fig. 8 shows the pin is engaged with the second notch in the hole of the pedal frame when the rails are positioned at the second position as shown in Fig. 6;

Fig. 9 is shows the elliptical exerciser with the pedal assembly of the present invention;

20 Fig. 10 shows the pin is engaged with the third notch in the hole of the pedal frame when the rails are positioned at the third position as shown in Fig. 9, and

Fig. 11 shows the pin is disengaged from the notches and located in the reset slot.

DETAILED DESCRIPTION OF THE PREFERRED

EMBODIMENT

Referring to Figs. 3 to 6, the elliptical exerciser of the present invention comprises a frame 20 having a wheel 30 connected thereto and a

5 crank 310 (Fig. 5) is connected to the wheel 30. Each one of two ends of the crank 310 has an extension link 31 and the extension links 31 are located on two sides of the wheel 30. A mediate portion of a connection bar 32 is pivotably connected to an end of each of the extension links 31 and the other end of each of the extension link 31 is connected to an end

10 of a handle 40. An end of each of the connection bars 32 is pivotably connected to a link 200 (Fig. 5) which is pivotably connected to the frame 20. Two rails 60 each have an end pivotably connected to the frame 20 and the other end of each of the rails 60 connected to a lifting device 70 which is a hydraulic cylinder so that the rails 60 can be raised by operating the

15 hydraulic cylinders.

Two pedal assemblies 50 each comprise a pedal frame 51 having two lugs 511 on a first end thereof which is pivotably connected to the other end of each of the connection bars 32. A second end of the pedal frame 51 has two side walls 512 and an end plate 514 is connected

20 between the two side walls 512. Each side wall 512 has a hole 513 and three notches 5131, 5132, 5133 are defined in an inside of the hole 513. Two rollers 53 are connected to each pedal frame 51 and movably engaged to the rail 60.

A pedal 52 has two connection plates 522 which are pivotably connected to the two side walls 512. Each connection plate 522 has hole 523 which is composed of a set slot 5231 and a reset slot 5232. The set slot 5231 and the reset slot 5232 communicate with each other and a angle 5 is defined between two axes of the set slot 5231 and the reset slot 5232.

A pin 54 extends through one of the set slot 5231 and the reset slot 5232 and the hole 513. A bolt 55 extends through the end plate 514 and is fixedly connected to a mediate portion of the pin 54. A spring 56 is mounted to the bolt 55 and biased between the pin 54 and the end plate 10 514.

The rails 60 is raised to its highest position in Fig. 5 and the pin 54 is located in the set slot 5231 and engaged with the first notch 5131. When the rails 60 are to be lowered to the position as shown in Figs. 7 and 8, the user simply pushes the pedal 52 counter clockwise and the pin 54 is 15 pulled by a periphery of the set slot 5231 and is disengaged from the first notch 5131. The pin 54 is then slid into the second notch 5132 by the spring 56. By this way, the pedal 52 is pivoted toward horizontal direction and the convenient for the user.

If the user wants to further lower the rails 60 as shown in Figs. 9 20 and 10, the user pivots the pedals 52 counter clockwise and to remove the pin 54 from the second notch 5132 to the third notch 5133.

Fig. 11 shows that when the user wants to remove the pin 54 from the third notch 5133 to another notch 5131 or 5132, the pedal 52 is

pivoted counter clockwise to remove the pin 54 from the third notch 5133, the pin 54 is then slid into the reset slot 5232. The pedal 52 is then pivoted clockwise to let the pin 54 enter to one of the three notches 5131, 5132, 5133.

5 The angle adjustable pedals allow the user to comfortably step on the pedals with proper angle according to the adjustment of the rails.

While we have shown and described the embodiment in accordance with the present invention, it should be clear to those skilled in the art that further embodiments may be made without departing from the 10 scope of the present invention.
